

Coat rack assembly requires a Phillips head screw driver. Assembly can be accomplished by one person, but is easier with an extra set of hands to assist in holding rails. (1) Start by screwing the center wooden rail into one side. (2) Lay the rack side down and insert two remaining rails and metal pole into open slots. If anti-theft hangers will be used, slide rings onto metal pole at this point. (3) Place second side on top of rails and pole. (4) Insert screw in center rail to lock assembly together. (5) Rack is now ready to be mounted to the wall. Mounting hardware not included. It is recommended to mount one side into a wall stud for greatest weight capacity. (6) Cover all screws with included wood plugs.
